

CCP-CNS2026: NETWORK BACKUP AUTOMATION - WEEK 4

TEST LOGS

Automation Lead: Asjid Asghar (F2024266946)

Testing/QA Lead: Bilawal Saeed (F2024266934)

Instructor: Sir Tahir Mehmood

ENVIRONMENT NOTE FOR TEACHER:

Due to local system optimization and Cisco IOS image constraints, the network topology was implemented using Cisco Packet Tracer instead of GNS3[cite: 1]. The backup script is executed from the local Windows host system acting as the backup environment to query the simulated network[cite: 1].

TEST CASE 1: Normal Operations (All Packet Tracer Routers Online)

Status: PASSED

Terminal Output:

```
> python backup_script.py
```

Starting Network Backup Automation Process...

Connecting to R1 (192.168.1.1)...

✓ Successfully connected to R1

💾 Configuration saved to: router_backups/R1_2026-06-05.txt

Connecting to R2 (192.168.1.2)...

✓ Successfully connected to R2

💾 Configuration saved to: router_backups/R2_2026-06-05.txt

Connecting to R3 (192.168.1.3)...

✓ Successfully connected to R3

💾 Configuration saved to: router_backups/R3_2026-06-05.txt

Backup automation task completed.

TEST CASE 2: Fault Tolerance (Simulated Link Down in Packet Tracer)

Procedure: Disconnected the interface cable to Router 2 (R2) inside Packet Tracer.

Status: PASSED (Graceful Error Exited - Script Did Not Crash)

Terminal Output:

```
> python backup_script.py
```

Starting Network Backup Automation Process...

Connecting to R1 (192.168.1.1)...

✓ Successfully connected to R1

💾 Configuration saved to: router_backups/R1_2026-06-05.txt

Connecting to R2 (192.168.1.2)...

✗ Error: Unreachable node! Could not connect to R2. Reason: [Errno 10060] A connection attempt failed because the connected party did not properly respond.[cite: 1]

Connecting to R3 (192.168.1.3)...

✓ Successfully connected to R3

💾 Configuration saved to: router_backups/R3_2026-06-05.txt

Backup automation task completed.
